

Get app details and grant permissions to app registration

Provision App Registration

App Registrations are containers that allow user-independent permission assignment and are therefore ideally suited for automation. App Registrations can be created in Azure Portal → Microsoft Entra ID → App Registrations. App Registrations should be preferred to service accounts whenever possible.

The following variables are used to authenticate to the Graph API using application permissions. The ClientSecret must not be stored as clear text in scripts or applications under any circumstances, but must be stored in designated containers (e.g. Azure Runbook Credential Store, Azure Key Vault or Windows Credential Store).

Variables used

\$TenantID: This is the identity of the tenant, which is unique.

\$ClientID: The ClientID can be used to uniquely identify the App Registration.

\$ClientSecret: The ClientSecret expires every max. 24 months (2 years) and is like the password for the App Registration.

Read ClientID & TenantID

The ClientID & TenantID can be read out on the start page of the App Registration itself.

The Microsoft identity platform is an authentic

Create client secret

For the ClientSecret you have to switch to the "Certificates & Secrets" tab. A ClientSecret can be added via "New client secret". Then a name can be given there. **Attention:** Afterwards the ClientSecret is valid for 24 months (2 years) and expires after a certain time. In addition, the value is only displayed once. Save the ClientSecret as the first step in your password storage solution and note the expirationdate.

scheme). For a higher level of assurance, we recommend using a certificate (instead of a client secret) as a credential.

Application registration certificates, secrets and federated credentials can be found in the tabs below.

Certificates (0) **Client secrets (2)** Federated credentials (0)

A secret string that the application uses to prove its identity when requesting a token. Also can be referred to as application password.

+ New client secret

Description	Expires	Value	Secret ID
Test for Screenshot	12/2/2024	tr:8Q~mNaCIpaWDirwBSy6D0gbPNdmd...	e82c8ae9-60ba-4d32-9f57-0bf53b160d0f

Grant permissions

As soon as the authentication via the app registration with the three values works, the permissions have to be assigned. This is a very tricky step, as an app could practically become a global administrator and overwrite or delete any tenant configurations.

The permissions on App Registrations for PowerShell Scripts must always be set to Application-Permissions, because the actions should be executed as App-Context.

Find the required permissions

The best way to find the required permissions is to visit the Microsoft Docs page for Graph API:
[Microsoft Graph REST API v1.0 endpoint reference - Microsoft Graph v1.0 | Microsoft Learn](#)

Namespace: microsoft.graph

Create a new **user**. The request body contains the user to create. At a minimum, you must specify the required properties for the user. You can optionally specify any other writable properties.

Note

To create external users, use the invitation API.

Permissions

One of the following permissions is required to call this API. To learn more, including how to choose permissions, see [Permissions](#).

Permission type	Permissions (from least to most privileged)
Delegated (work or school account)	User.ReadWrite.All, Directory.ReadWrite.All
Delegated (personal Microsoft account)	Not supported.
Application	User.ReadWrite.All, Directory.ReadWrite.All

Copy

Assign permissions

Once it has been determined which permissions need to be assigned, this can be done in Azure Portal → Microsoft Entra ID → App Registration → API permissions.

First, "Add a permission" must be selected and then Microsoft Graph as an API resource.

Home > B2B > App registrations > AAP-IS-ALL-SSO-AdventskalenderJumpNRun-NONPROD > API permissions

Configured permissions

Applications are authorized to call APIs when they are granted permissions by administrators as part of the consent process. The list of configured permissions should include all the permissions the application needs, both from third parties and consent.

Microsoft Graph

Access to Microsoft Graph is a broad-based set of permissions that allows applications to access data in Microsoft 365, Dynamics 365, and Windows 10. It includes permissions for Microsoft Graph, Microsoft Exchange, Microsoft Teams, and more through a single endpoint.

Access Back

Schedule large-scale updates and API applications in the cloud.

Access Communication Services

Rich communication experiences with the same APIs that customers used by Microsoft Teams.

Access Content DB

For Microsoft 365, database with open APIs for my data.

Access Data Catalog

Access to data in the Microsoft Data Catalog.

Access Data Explorer

Access to all the queries in the Microsoft Data Explorer.

Access Data Lake

Access to storage and compute for big data analytics.

Access DevOps

Integrate with Azure DevOps and Azure DevOps.

Access Insights/Report

Programmatic control of Insights/Report API.

Access Key Vault

Manage your key vaults as well as the key vaults.

Access Maps

Unified data governance service that helps you manage and govern your primary, multi-cloud, and software on various data sets.

Access Partner

Unified data governance service that helps you manage and govern your primary, multi-cloud, and software on various data sets.

Access Quantum

Programmatically access to create and manage jobs in Azure Quantum.

Access Rights Management Service

Access to the rights management service.

Access Service Management

Programmatic access to the Service Management API.

Access Storage

Access to the storage service, object and blob data storage for Microsoft 365 and other Microsoft data.

Then it is important that "Application permissions" is selected. There you can then search for the corresponding permission from the Microsoft Docs page and add it using "Add permissions".

Request API permissions

[Add permissions](#)
[Discard](#)

Now that the permission has been added thanks to the previous step, the last thing to do is to check it and then approve it. This can only be done with the "Global Administrator" role, as the app will then receive this permission forever and this is like assigning a role. The person who has Global Administrator must click on "Grand admin consent for <companyname>" in the app so that the permissions also become active.

Applications are authorized to call APIs when they are granted permissions by users/admins as part of the consent process. The list of configured permissions should include all the permissions the application needs. [Learn more about permissions and consent](#)
