Save money with lifecycle policies

General information

Data sets have unique lifecycles. Early in the lifecycle, people access some data often. But the need for access often drops drastically as the data ages. Some data remains idle in the cloud and is rarely accessed once stored. Some data sets expire days or months after creation, while other data sets are actively read and modified throughout their lifetimes. Azure Storage lifecycle management offers a rule-based policy that you can use to transition blob data to the appropriate access tiers or to expire data at the end of the data lifecycle.

Create lifecycle policy

1. Open storage account

2. Create rule and give name to the policy and set the scope and blob type / subtype.

1 Details **2 Base blobs**

A rule is made up of one or more conditions and actions that apply to the entire storage account. Optionally, specify that rules will apply to particular blobs by limiting with filters.

Rule name *

Enter a name

Rule scope *

☒ Apply rule to all blobs in your storage account

☐ Limit blobs with filters

Blob type *

☒ Block blobs

☐ Append blobs

Blob subtype *

☒ Base blobs

☐ Snapshots

☐ Versions

3. The last step is to create conditions and apply actions on the blob.

1 Details **2 Base blobs**

Lifecycle management uses your rules to automatically move blobs to cooler tiers or to delete them. If you create multiple rules, the associated actions must be implemented in tier order (from hot to cool storage, then archive, then deletion).

If

Base blobs were *

☒ Last modified

☐ Created

More than (days ago) *

Enter a value

↓

Then

Delete the blob

↓

+ Add conditions

List table content with PowerShell via OAuth 2.0 authentication

Requirements: Permissions to create an App Registration and PowerShell Modules "AzTable" & "Az.Storage".

This tutorial describes how to use content from an Azure Storage Table in a PowerShell script. The authentication against the Azure Storage API is unattended and credentials are handled with an App Registration.

Create App Registration

Create a new App Registration and get the three variables as described in this guide: [Get app details and gr...](#) | LNC DOCS ([lucanoahcaprez.ch](#))

Add API permission

The only required permission for this App Registration is "user_impersonation". This permission can be found under the Azure Service Management API.

Request API permissions

< All APIs

 Azure Service Management
<https://management.azure.com/> [Docs](#) 

What type of permissions does your application require?

Delegated permissions

Your application needs to access the API as the signed-in user.

Application permissions

Your application runs as a background service or daemon without a signed-in user.

Select permissions

[expand all](#)

 Start typing a permission to filter these results

 The "Admin consent required" column shows the default value for an organization. However, user consent can be customized per permission, user, or app. This column may not reflect the value in your organization, or in organizations where this app will be used. [Learn more](#) 

Permission	Admin consent required
▼ Permissions (1)	
<input checked="" type="checkbox"/> user_impersonation ⓘ Access Azure Service Management as organization users	No

Grant permissions to Azure Storage Account

After you got all variables (Tenant ID, Client ID & Client Secret) you can add the permissions for Azure RBAC to the created App Registration. You need to go to the corresponding storage account within the azure portal. There you have to add the "Storage Account Contributor" role under "Access Control IAM":

Role Members [Review + assign](#)

Selected role Storage Account Contributor

Assign access to ☒ User, group, or service principal
☐ Managed identity

Members [+ Select members](#)

Name	Object ID	Type
AAP-FUNC-ALL-PERMISSION-GetStorag...	0f9b3930-fda9-48e1-b2d9-a2d511fd6487	App

Description

Unfortunately, the "Storage Account Contributor" role is mandatory and restricting to a Storage Table Reader for example is not possible, otherwise the data cannot be read.

PowerShell Code

The following code can be used to read the data from the storage table specified. Here it is important that the variables are filled in correctly and that the PowerShell modules are accessible.

```
$TenantID = "<tenantid>"
$ClientId = "<cliendid>"
$ClientSecret = "<clientsecret>"

$SubscriptionId = "<subscriptionid>"
$resourceGroupName = "<resourceGroupName>"
$storageAccName = "<storageaccountname>"
$tableName = "<tablename>"

Import-Module -Name Az.Storage
Import-Module -Name AzTable

$Password = ConvertTo-SecureString -AsPlainText $ClientSecret -Force
$Credential = New-Object System.Management.Automation.PSCredential ($ClientId, $Password)
$ctx = Connect-AzAccount -ServicePrincipal -Credential $Credential -Tenant $TenantId -Subscription
$SubscriptionId
$ctx=(Get-AzStorageAccount -ResourceGroupName $resourceGroupName -Name $storageAccName).Context

$cloudTable = (Get-AzStorageTable -Name $tableName -Context $ctx.context).CloudTable
$TableContent = Get-AzTableRow -table $cloudTable
```

Write table content with PowerShell via OAuth 2.0 authentication

This tutorial describes how to add new content to an Azure Storage Table with a PowerShell script. The authentication against the Azure Storage API is unattended and credentials are handled with an App Registration.

Preparations

To gain access to the storage table you need to initialize an App Registration and add permission & a client secret. Then you have to add the Azure RBAC role to the storage account. Everything is documented here in detail: [List table content wit... | LNC DOCS \(lucanoahcaprez.ch\)](#)

PowerShell Code

The following code can be used to write data to the storage table specified. Here it is important that the variables are filled in correctly and that the PowerShell modules are accessible.

```
$TenantID = "<tenantid>"
$ClientId = "<cliendid>"
$ClientSecret = "<clientsecret>"

$SubscriptionId = "<subscriptionid>"
$resourceGroupName = "<resourceGroupName>"
$storageAccName = "<storageaccountname>"
$tableName = "<tablename>"

Import-Module -Name Az.Storage
Import-Module -Name AzTable
```

```
$Password = ConvertTo-SecureString -AsPlainText $ClientSecret -Force
$Credential = New-Object System.Management.Automation.PSCredential ($ClientId, $Password)
$ctx = Connect-AzAccount -ServicePrincipal -Credential $Credential -Tenant $TenantId -Subscription
$SubscriptionId

$ctx = (Get-AzStorageAccount -ResourceGroupName $resourceGroupName -Name $storageAccName).Context

$cloudTable = (Get-AzStorageTable -Name $tableName -Context $ctx.context).CloudTable

Add-AzTableRow -partitionKey "dn" -Rowkey "$DomainName" -table $cloudTable -property @{ "<property1>" =
"value1"; "<property2>" = "value2"; "<property3>" = "value3"; } | Out-Null
```

Upload Log Files to Azure Blob Storage via PowerShell

When troubleshooting Windows installations, upgrades, or updates, collecting log files like setupact.log or WindowsUpdate.log is essential. This blog provides a simple PowerShell script to automatically upload these files to Azure Blob Storage, making it easier to gather diagnostics from end-user devices. The script is designed for flexible use without any requirement for PowerShell modules. It can either be run manually or deployed through tools like Intune, SCCM, or NinjaOne. The goal is to collect logs without interfering the work of end users.

Security considerations

To keep data secure, use a SAS (Shared Access Signature) token that is limited to write-only access and has a defined expiration. Make sure to use a separate container for this automation. Don't let the SAS token be able to access other locations than the specified container. Avoid hardcoding credentials into shared scripts, and store tokens securely if possible.

Prerequisites

To use this script, you'll need an Azure Storage account with a container and a valid SAS (Shared Access Signature) token that allows write access (More information: [Create SAS tokens for storage containers and blobs | Microsoft Learn](#)). Make sure that the script gets executed with administrator rights, since some paths for the log sources are in system protected folders. Finally, ensure the device has internet access and can reach Azure Blob endpoints over HTTPS.

PowerShell Script

This script gathers key log files from standard Windows locations and uploads them securely to Azure Blob Storage using a SAS token. Uploaded logs are automatically named and organized into folders based on the device's hostname and timestamp. The script also includes basic error handling and checks if files exist before attempting upload.

Storage and File Locations

The script uploads files to a specific Azure Blob container under a folder named after the device's hostname. Each file is named with a timestamp, hostname, and sanitized file path, such as:

```
PC123_logs/250614_135200_PC123_C_Windows_Panther_setupact.log
```

```
function Upload-LogFilesToBlob {
    param (
        [Parameter(Mandatory = $true)]
        [string[]]$Path
    )

    # Set your static SAS URL prefix
    $baseUploadUrl = "https://<storageaccountname>.blob.core.windows.net/<rootfolder>"
    $sasToken = "<storageaccountsastoken>"

    foreach ($filePath in $Path) {
        if (-Not (Test-Path $filePath)) {
            Write-Warning "File not found: $filePath"
            continue
        }

        # Escape full path to make it filename-safe
        $escapedPath = $filePath -replace '[\V:*?"<>|]', '_'

        # Construct blob name inside a folder named by hostname
        $blobFolder = "$(hostname)_logs"
        $blobName = "$blobFolder/$(Get-Date -Format 'yyMMdd_HHmmss')_$(hostname)_$escapedPath"

        $uploadUrl = "$baseUploadUrl/$blobName$sasToken"

        $headers = @{
            "x-ms-blob-type" = "BlockBlob"
        }

        $fileBytes = [System.IO.File]::ReadAllBytes($filePath)

        try {
            Invoke-RestMethod -Uri $uploadUrl -Method Put -Headers $headers -Body $fileBytes
            Write-Output "Uploaded: $filePath"
        }
    }
}
```

```
}  
catch {  
    Write-Warning "Failed to upload: $_"  
}  
}  
}
```

```
Get-WindowsUpdateLog -LogPath "C:\Windows\Logs\WindowsUpdateLog.log"
```

```
Upload-LogFilesToBlob -Path @(  
    "C:\Windows\Panther\setupact.log",  
    "C:\Windows\Panther\setuperr.log",  
    "C:\Windows.old\Windows\Panther\setupact.log",  
    "C:\Windows.old\Windows\Panther\setuperr.log",  
    "C:\Windows\Logs\WindowsUpdateLog.log"  
)
```
